Curriculum for One-Year M. S. Program
Department of Mathematics
University of Dhaka
(Effective for 2021-2022 and 2022-2023)

The Department offers M. S. (Masters of Science) program in Mathematics. The M.S. program has duration of one academic year. In the program, there is provision for taking up thesis work, subject to the approval of the academic committee of the department.

Each student in **Group A** (**Non-Thesis Group**) of the program has to take **seven** courses (each of 4 credits), while each student in **Group B** (**Thesis Group**) has to take **six** courses, out of the courses enumerated below, subject to conditions laid down by the academic committee.

Group A (Non-Thesis Group)   **32 Credits**
Credit Requirement

7 Courses, 28 Credits
Viva Voce 4 Credits

Group B (Thesis Group)   **36 Credits**
Credit Requirement

6 Courses, 24 Credits
Thesis 8 (6+2) Credits
Viva Voce 4 Credits

List of Courses for M. S. Program

MTMS 501	THEORY OF GROUPS	4 Credits
MTMS 502	THEORY OF RINGS AND MODULES	4 Credits
MTMS 503	ADVANCED NUMBER THEORY	4 Credits
MTMS 504	REAL FUNCTION THEORY	4 Credits
MTMS 505	COMPLEX FUNCTION THEORY	4 Credits
MTMS 506	GENERAL TOPOLOGY	4 Credits
MTMS 507	FUNCTIONAL ANALYSIS	4 Credits
MTMS 508	LIE GROUPS AND LIE ALGEBRAS	4 Credits
MTMS 509	FUZZY MATHEMATICAL STRUCTURES	4 Credits
MTMS 510	DIFFERENTIAL AND INTEGRAL EQUATIONS	4 Credits
MTMS 511	OPERATIONS RESEARCH	4 Credits
MTMS 512	NUMERICAL METHODS FOR DIFFERENTIAL EQUATIONS	4 Credits
MTMS 513	GEOMETRY OF DIFFERENTIAL MANIFOLDS	4 Credits
MTMS 514	DYNAMICAL SYSTEMS	4 Credits
MTMS 515	MATHEMATICAL BIOLOGY	4 Credits
MTMS 516	OPERATIONS MANAGEMENT	4 Credits
MTMS 517	QUANTITATIVE FINANCIAL RISK MANAGEMENT	4 Credits
MTMS 518	SPECIAL TOPICS	4 Credits
MTMS 590	MS THESIS	8 Credits
MTMS 599	VIVA VOCE	4 Credits

MTMS 501:THEORY OF GROUPS	**Credits: 4**

Rationale:

Theory of groups and representations is key to many branches of sciences and mathematics such as studying symmetries in geometry, Conservation laws of physics are related to the symmetry of physical laws under various transformations, group theory predicted the existence of many elementary particles before they were found experimentally. The structure and behavior of molecules and crystals depends on their different symmetries. Group theory shows up in many other areas of geometry and Topology. Examples include different kinds of groups, such as the <u>fundamental group</u> of a space. Classical problems in algebra have been resolved with group theory. Cryptography uses a lot of group theory. Different cryptosystems use different groups. This a course that may be studied for its own sake or from view point of applications.

*Course Objectives***:**

By the end of the module, students should be familiar with the topics listed in the Course Contents. In particular, students will be able to prove the Class Equation for finite Groups, learn the techniques to prove Sylow Theorems and their applications for analyzing the structures of Finite Groups of given orders. They should be able to find Extensions and Split Extensions of groups; find Representation using Matrix; prove Schur's Lemma, Maschke's Theorems; find Group Characters.

*Learning Outcomes***:**

The main Learning Outcomes, after completing this module, will be
1. To understand basic ideas and applications of Groups
2. To get introduced to different terminologies and properties of Finite Groups
3. To get familiar with different classes of Groups, such as Symmetry Groups, Permutation Groups, Dihedral Groups, Klein4 Groups
4. To find and prove the Class Equation for Finite Groups
5. To learn the techniques of proofs of Sylow Theorems in the module
6. To learn to apply Representation Theory of Groups and decomposition into irreducible representations to find Group Characters of Finite Groups

Course Contents:
1. **Finite Abelian group:** Fundamental theorem of finite Abelian group.
2. **Group action:** Conjugation, Class equation if finite group, Orbit Stabilizer theorem, Automorphism and inner automorphism.
3. Free products of groups and Free groups.
4. **Sylow Theorems:** Finite p-groups, classification of Groups of order p, p^2, pq, p^3
5. **Group Extensions**: Direct Products, Cyclic Extentions, Split Extentions, Semi-direct Product, Wreath Products, and Tensor product.
6. Solvable, Super solvable, Nilpotent Groups and their subgroups; Commutator Group, Composition series, Normal series, Factor Groups; Upper and Lower Central Series
7. Permutational and Matrix Representation of Groups, Reducibility, Schur's Lemma, Maschk's Theorem

8. Group Characters, Reducible, Irreducible, Faithful Characters; Orthogonality of First and Second Kind.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**.**Eight** questions of equal value will be set, of which any **Five** are to be answered.

MTMS 502:THEORY OF RINGS AND MODULES	Credit: 4

Rationale:

A ring is an important fundamental concept in algebra and includes integers, polynomials and matrices as some of the basic examples. Ring theory has applications in number theory and geometry. A module over a ring is a generalization of vector space over a field. The study of modules over a ring *R* provides us with an insight into the structure of *R*. In this course we shall develop ring and module theory leading to the fundamental theorems of Wedderburn and some of its applications.

Course Objectives:

By the end of the course the student should understand:
1. The importance of rings and modules as central objects in algebra and some of its applications.
2. The basic structure and theory of rings and modules.
3. How to develop this theory to investigate important classes of integral domains.
4. The concept of a module as a generalization of a vector space and an Abelian group.
5. The classification of any finitely generated module as a homomorphic image of a free module.
6. Simple modules, Schur's lemma. Radical, simple and semi simple artinian rings. Examples.
7. Semi-simple modules, artinian modules, their endomorphism. Examples.
8. The Wedderburn-Artin theorem.

Learning Outcomes:

Upon successful completion of this course students will be able to:
1. Understand the central role of abstract algebra in modern mathematics.
2. See the relations between algebra and its applications in and outside mathematics.
3. Become familiar with rings and fields, and understand the structure theory of modules over a Euclidean domain along with its implications.
4. Write precise and accurate mathematical definitions of objects in ring theory.
5. Use mathematical definitions to identify and construct examples and to distinguish examples from non-examples.

6. Validate and critically assess a mathematical proof.
7. To understand how every finitely generated module is a homomorphic image of a free module.
8. Use a combination of theoretical knowledge and independent mathematical thinking to investigate questions in ring theory and to construct proofs.
9. Write about ring theory in a coherent, grammatically correct and technically accurate manner.

Course Contents:
1. **Some Topics in the Theory of Rings:** Polynomial rings over Unique Factorization Domain (UFD), Wedderburn's and Jacobson's Theorems, the Radical, Semisimple and Simple rings.
2. **Rings of Fractions:** Rings of fractions and embedding theorems, local rings and Noetherian rings, Rings with Ore conditions and related theorems.
3. **Field Theory:** Irreducible Polynomials and Eisenstein criterion, Algebraic extensions of fields, Splitting fields and Finite fields.
4. **Modules and vector spaces:** Definition and examples, submodules and direct sums, *R*-homomorphisms and quotient modules, completely reducible and free modules, projective and injective modules, Noetherian and Artinian rings and modules. Wedderburn-Artin theorem.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**. **Eight** questions of equal value will be set, of which any **Five** are to be answered.

MTMS 503: ADVANCED NUMBER THEORY   Credits: 4

Rationale:
Number theory is a broad subject with many strong connections with other branches of mathematics. The idea of the course is to give a solid introduction to quadratic fired and algebraic number theory. It will be bridging the gap between elementary number theory and the systematic study of advanced topics.

Course Objectives:
The main objective of the course is for students to
- Learn quadratic field specially, Euclidian quadratic fields
- Get idea on quadratic residues, and law of quadratic reciprocity.
- Learn the distribution of prime numbers. An extended idea on prime number theory and several arithmetical functions related to prime number theory.

- Get an idea on Algebraic Number theory.

Learning Outcomes:

On completion of this course the students will learn
- Arithmetic of Euclidian quadratic field. quadratic residues, Jacobi's symbol, gauss lemma, and law of quadratic reciprocity. They can extend their idea on Quadratic residuacity for further ideas.
- Arithmetic functions and average orders of arithmetic functions.
- The distribution of prime numbers. An extended idea on prime number theory and several arithmetical functions related to prime number theory, the function $\theta(x)$ and $\psi(x)$. They will see the elementary proof as well as complex analytical proof of prime number theorem.
- Get an idea on Algebraic Number theory and get direction for future study on this area.

Course Content:

1. **Quadratic Fields:** Arithmetic of quadratic fields, Euclidean quadratic fields.
2. **Quadratic Residuacity:** Quadratic residues and nonresidues, Euler criterion, Legendre symbol, Gauss's lemma, law of quadratic reciprocity, Jacobi' s symbol.
3. **Average orders of Arithmetic Functions:** Lim sup, Lim inf, average orders of arithmetical functions.
4. **Distribution of Prime Numbers:** Bertrand's postulate, Chebyshev's theorem, the function $\theta(x)$ and $\psi(x)$. The prime number theory; elementary proof via Selbdrg's lemma, complex analytical proof.
5. **Primes in Arithmetic Progressions:** Characters of an abelian group, L-functions, Dirichlet's proof of infinitude of primes in arithmetic progressions.
6. **Algebraic Number Theory:** Noetherian ring and Dedekind domains, ideal classes and the unit theorem, units in real quadratic field.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**.
Eight questions of equal value will be set, of which any **Five** are to be answered.

| **MTMS 504:Real Function Theory** | **Credits: 4** |

Rationale:

This is a continuation of a course on introduction to measure theory in R^n offered in the senior of undergraduate program. The general abstract theory of measure, integration, and their applications is therefore in order for a complete knowledge of the subject.

*Course Objectives***:**

The objectives of the course include introducing students to the ideas of abstract measure and its properties, integration of real function on an abstract measure space and its properties, and finally their applications in modern analysis.

*Learning Outcomes***:**

Students will learn abstract theory of measures, integrations and their applications in modern analysis.

Course Contents:

1. **Further Topics of Lebesgue Integration On *R*:** Uniform intergability, Vitaliconvergence theorem, Convergence in Measure, Characterization of Riemann Lebesgue intergability, continuity, absolute continuity, and differentiability of monotone functions, Functions of bounded variations, Differentiating indefinite integrals, and convex functions.
2. **General measure spaces, their properties and construction:** measures and measurable sets, signed measure (Hahn and Jordan decomposition), measure induced from outer measure, extension of a pre measure to a measure.
3. **Integration over general measure spaces:** measurable functions and their integration, the Radon-Nikodym theorem.
4. **Construction of some particular measures:** product measure and theorem of Fubini and Toneli, Caratheodory outer measure and Hausdorff measures in a metric space.
5. **The general L^p spaces:** L^p spaces of functions of one real variable, general L^p spaces,completeness, duality, and weak convergence.
6. **Measure and Topology:** construction of Radon measures, Bair measures. Kakatuni's fixed point theorem, Invariant Borel measures and von Neumann's theorem.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**.**Eight** questions of equal value will be set, of which any **Five** are to be answered.

MTMS 505:COMPLEX FUNCTION THEORY	**Credits: 4**

Rationale:

Complex analysis is indeed is one of the classical subjects with most of the main results extending back into the nineteenth century and earlier. Yet, the subject is far from dormant. It is a launching point for many areas of research and it continues to find new areas of applicability, from pure mathematics to applied physics. A graduate course in Complex Analysis has the potential to address many learning outcomes that are important in studying mathematics. The subject has connections to several other mathematical areas and it provides students with opportunities to build a deeper cognitive mathematical framework.

Course Objectives:

This course is intended both for continuing mathematics studentsthat presents an introduction to some advanced topics of contemporary complex analysis. The purpose is to prepare the student to independent work in these topics and specially to use the methods of complex analysis in other areas of mathematics (for example harmonic analysis and differential equations) as well as in applied areas (fluid dynamic, signal analysis, statistics). The students should be able to participate in scientific discussions and conduct researches on high international level in contemporary and classical complex analysis and its applications.

Learning Outcomes:

On completion of this course the students will have the knowledge and skills to:

1. Explain the fundamental concepts of complex analysis and their role in modern mathematics and applied contexts
2. Demonstrate accurate and efficient use of complex analysis techniques
3. Demonstrate capacity for mathematical reasoning through analyzing, proving and explaining concepts from complex analysis
4. Apply problem-solving using complex analysis techniques applied to diverse situations in physics, engineering and other mathematical contexts.

Course Contents:

5. **Convergence:** Uniform convergence of power series. Weierstras's theorem. Absolute and uniform convergence of infinite products.
6. **Analytic Functions:** Open mapping theorem, Maximum modulus principle, Convex functions, Hadamard three-circles theorem. Caratheodory's inequality. Theorems of Poisson, Jensen, Borel and Caratheodory. Space of analytic functions.
7. **Harmonic Functions:** Basic properties, Mean value theorem. Maximum modulus principle, Poisson's Kernel, Harmonic functions of a disc. Dirichlet problem on a disc.
8. **Power Series:** Basic Properties, Relations among power series, Fourier series and Dirichlet series. Sufficient conditions of regular and singular points. Theorems of Hurwitz, Vitali and Montel.
9. **Entire Functions:** Basic properties, Order, type. Growth properties of entire functions with their Zeros. Jensen's Inequality for entire function. Expression of order and type in terms of Taylor coefficients. Hadamard product of entire functions, order and type.

10. **The Space C^n**: Introduction to the theory of analytic function of several complex variables. Formal power series about z in C^n, Poly-cylinder, Distinguished boundary. Reinhardt domain, analytic function. Complex holomorphic functions. Taylor series expansion. Cauchy's integral.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**.**Eight** questions of equal value will be set, of which any **Five** are to be answered.

MTMS 506:GENERAL TOPOLOGY	Credits: 4

Rationale:

Geometry has grown out of efforts to understand the world around us, and has been a central part of mathematics from the ancient times to the present. Topology has been designed to describe, quantify, and compare shapes of complex objects. Together, geometry and topology provide a very powerful set of mathematical tools that is of great importance in mathematics and its applications. This module will introduce the students to the mathematical foundation of modern geometry based on the notion of distance. We will study metric spaces and their transformations. Through examples, we will demonstrate how a choice of distance determines shapes, and will discuss the main types of geometries. An important part of the course will be the study of continuous maps of spaces. A proper context for the general discussion of continuity is the topological space, and the students will be guided through the foundations of topology. Geometry and topology are actively researched by mathematicians and we shall indicate the most exciting areas for further study.

Course Objectives:

The main objective of this topic is to compare several notions that describe convergence in topological spaces.The objectives of this course are to:

1. review of basic topological concepts such as weak and strong topologies, relativization of a topology to a subset, continuous mappings
2. discussion of product topologies and introduce quotient spaces
3. introduce convergence of nets and filters in a topological space
4. demonstrate concepts of countability and separation axioms, notion of Lindelöf space, proof of Urysohm's Lemma. To give the idea how a topological space depends upon the distribution of open sets in the space and introduce the connection between different spaces such as regular spaces, completely regular spaces, and normal spaces, Urysohn metrization theorem (Statement) and Tietze Extention theorem(Statement).

5. introduce student the concept of compactness by describing generalization of finiteness and Heine-Borel theorem to demonstrate notions of compactness and compactification constructions
6. introduce the notion of different types of connected spaces and the relation between pathwise and local connectedness, components, path components, locally path connectedness.
7. introduce the notion of Metrization and Baire category theorem
8. introduce to the concept of uniform topological space and metrizable space, and their relation.
9. introduce to the concept of Functional spaces and establish a relation between point-wise and uniform convergences
10. introduce students to the notion of Commutative Topological Groups, Bases, Subgroups and Quotient groups, completion of topological groups, continuous homomorphisms, Groups of functions
11. develop the student's ability to handle abstract ideas in topology to understand real world applications

*Learning Outcomes***:**
Upon successful completion of this course, the student will be able to
1. understand the proofs of convergence of filters and nets. Also, Students will learn that convergence of filters and nets are generalization of convergence of sequence.
2. determine for a given topology which countability and separation properties it has.prove Urysohm's Lemma. Students will learn the connection between different spaces such as regular spaces, completely regular spaces, and normal spaces. Students will also understand the characterization of normality.
3. understand to work with various notions of compactness and be familiar with various compactification constructions.
4. learn about Metrization and they will learn about Baire category theorem.
5. learn about connected spaces. They will also understand the relation between Pathwise and local connectedness, and components, path components, locally path connectedness.
6. study the important relation: "If a uniformity is metrizable, so is the uniform topology it generates. In the opposite direction, metrizability of the uniform topology does not imply that the uniformity itself is metrizable".
7. gain knowledge of Functional spaces and establish a relation between point-wise and uniform convergences. They will able to distinguish uniform and point-wise convergences.
8. learn the notion of different properties of commutative topological groups.

Course Content:
1. **Review of basic topological concepts:** Bases and subbases, Relativization of a topology to a subset, Continuous functions, Weak and strong topologies.
2. **Product and quotient topological spaces:** Constructing continuous functions, Pasting lemma, Maps into products, Product topology, Uniform topology on $\mathbb{R}^J$, Uniform limit theorem, Quotient topology.
3. **Convergence:** Convergence of nets and filters.
4. **Countability properties and Separation axioms:** Lindelöf space, Regular spaces, Completely regular spaces, Normal spaces, Characterization of Normality, Urysohn lemma, Statements of Urysohn metrization theorem and Tietze Extention theorem.

5. **Compactness:** Compact and locally compact spaces, Uniform continuity theorem, Compactification.
6. **Connected spaces:** Path connectedness, locally connectedness, components, Path components, Locally path connectedness.
7. **Metrization:** Baire space, Baire category theorem.
8. **Uniform spaces:** Uniformisability and uniform metrisability.
9. **Function spaces:** Topology of pointwise convergence, Topology of uniform convergence, Compact open topology.
10. **Topological Groups:** Topological group, Elementary properties, Bases, Subgroups and Quotients of topoloical groups, completion of topological groups, Continuous homomorphisms, Groups of functions, Uniformities and metrisation.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**.**Eight** questions of equal value will be set, of which any **Five** are to be answered.

MTMS 507: FUNCTIONAL ANALYSIS   Credits: 4

Rationale:

This course will cover the foundations of functional analysis in the context of topological linear spaces and normed linear spaces. This course is a natural follow of the course Topology; while the main focus of Convex sets and hyperplanes, seminorms, locally convex spaces, weak topology, compact convex sets, duality in Banach spaces. Then the linear analysis is on Hilbert spaces with its rich geometrical structures will work with normed linear spaces. The Big Theorems (Uniform Boundedness, Open Mapping and Closed Graph) will be presented and several applications will be analyzed. The important notion of duality will be developed in Banach and Hilbert spaces and an introduction to spectral theory for compact operators will be given. Moreover, Bilinear and quadratic forms, symmetric operators, normal and self-adjoint operators and spectral analysis in Hilbert Spacesfor bounded self-adjoint operators and unbounded self-adjoint operators will be analyzed. Despite working in this more general framework many results on Nonlinear Compact Operators and Monotonicity will be re-introduced in this course in more general form. For example, Banach Fixed point theorem with applications, Schauder fixed point theorem, Frechet derivative, Newton's method for nonlinear operators, positive and monotone operators will be introduced.

*Course Objectives***:**

Upon completion of this course, students will explore the followings:
1. Facility with the main, big theorems of functional analysis.

2. Learn the fundamental concepts of Topological Linear Spaces and study of the properties of bounded linear maps between topological linear spaces of various kinds.
3. Ability to use duality in various contexts and theoretical results from the course in concrete situations.
4. Capacity to work with families of applications appearing in the course, particularly specific calculations needed in the context of famous theorem.
5. Be able to produce examples and counter examples illustrating the mathematical concepts presented in the course.
6. Understand the statements and proofs of important theorems and be able to explain the key steps in proofs, sometimes with variation.

*Learning Outcomes***:**

On successful completion of this course unit students will be able to
1. know and use the properties of topological linear spaces. Also, explain the concepts of Convex sets and hyperplanes, seminorms, locally convex spaces, weak topology, compact convex sets, duality in Banach spaces.
2. get familiar with the Linear Operators, in particular Continuity and boundedness, fundamental properties of bounded operators, uniform boundedness principle, Open Mapping and Closed Graph theorem, conjugate of bounded linear operators, adjoint operator and its duality, bounded linear operators in Hilbert spaces, unbounded linear operator.
3. understand the concept of spectral analysis of linear operators and be able to analyze the necessary problems and theorems on the spectrum and the resolvent operator, spectrum of a bounded linear operator and compact operators.
4. get familiar of spectral analysis in Hilbert Spaces and describe the basic terminologies appeared in bilinear and quadratic forms, symmetric operators, normal and self-adjoint operators, the spectral theorem for bounded self-adjoint operators, unbounded self-adjoint operators.
5. learn on Nonlinear Compact Operators and Monotonicity and deal with the Fixed point theorems and to recognize their applications.
6. computeFrechet derivative and apply Newton's method for nonlinear operators, positive and monotone operators.

Course Content:
1. **Topological Linear Spaces:** Convex sets and hyperplanes, seminorms, locally convex spaces, weak topology, compact convex sets, duality in Banach spaces.
2. **Linear Operators:** Continuity and boundedness, fundamental properties of bounded operators, uniform boundedness principle, conjugate of bounded linear operators, adjoint operator and its duality, bounded linear operators in Hilbert spaces, unbounded linear operator.
3. **Spectral Analysis of Linear Operators**: Spectrum and the resolvent operator, spectrum of a bounded linear operator, compact operators.
4. **Spectral Analysis in Hilbert Spaces:** Bilinear and quadratic forms, symmetric operators, normal and self-adjoint operators, the spectral theorem for bounded self-adjoint operators, unbounded self-adjoint operators.

5. **Nonlinear Compact Operators and Monotonicity:** Banach Fixed point theorem with applications, Schauder fixed point theorem, Frechet derivative, Newton's method for nonlinear operators, positive and monotone operators.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**.**Eight** questions of equal value will be set, of which any **Five** are to be answered.

MTMS 508: LIE GROUPS AND LIE ALGEBRAS   Credits: 4

Rationale:

Lie groups are continuous groups of symmetries, like the group of rotations of n-dimensional space or the group of invertible n-by-n matrices. In studying such groups we can use tools from calculus to linearize our problems, which leads us to the notion of a Lie algebra: a vector space with an antisymmetric product associated to any Lie group, which remembers everything about its algebraic structure. For example, the Lie algebra associated with the group of rotations of 3-space is just 3-dimensional Euclidean space with (twice) the vector cross product.

Lie algebras appear in mathematics in many ways.
  i.   They represent the local structure of Lie groups, groups with a differentiable structure.
 ii.   They represent infinitesimal actions on vector spaces, actions satisfying rules like the Leibniz rule $d(fg) = f\,dg + g\,df$.
iii.   They represent the non-commutativity of an associative algebra. We will be studying Lie algebras from several points of view: algebraic; combinatorial; and geometric.

*Course Objectives***:**

This course is divided into two halves. In the first half we introduce the notion of a closed linear group and the relationship between a closed linear group and its linear Lie algebra which will serve you well in later part of the course. We prove that any closed linear group becomes a Lie group. In the second half of the course, we turn our attention to the connection between Lie algebras and Lie groups. This will involve some ideas from geometry (manifolds and tangent spaces).

At the title suggests, this is a first course in the theory of Lie groups and Lie algebras. We focus on the so-called matrix Lie groups since this allows us to cover the most common examples of Lie groups in the most direct manner and with the minimum amount of background knowledge. We mention the more general concept of a general Lie algebra of a Lie group, but do not spend much time working in this generality. After some motivating examples involving quaternions, rotations and reflections, we give the definition of a matrix Lie group and discuss the well-studied examples, including the classical Lie groups. We then study

the topology of Lie groups, their maximal tori, and their centres. We conclude with a discussion of differential (adjoint) representation.

Learning Outcomes:

Students will have developed

1. mathematical intuition and problem-solving capabilities;
2. understanding of which tool is appropriate to tackle which problem;
3. ability to find information through tools like the world-wide web to solve problems;
4. ability to use computers to illustrate arguments;
5. competency in mathematical presentation, and written and verbal skills.

Course Content:

1. **Manifolds:** Some basic notation and terminology, Manifolds and differentiable manifold; some important results on manifolds.
2. **Closed Linear Groups:** Topological groups, Lie Algebras of the closed linear groups.
3. **The Exponential of a Matrix:** Convergent power series, matrix power series.
4. **Lie Groups and Lie Algebras:** Lie groups, A matrix representation of the topological group R. Linear Lie groups, Lie subgroups.
5. **Lie Algebras:** The exponential map of a Lie group, General Lie algebras.
6. **Analyticity of Lie Groups:** The Lie algebra defined by a Lie group, Local coordinates, Abelian and reductive Lie groups.
7. **Correspondence between Lie Groups and Lie Algebras:** Tangent space and vector fields, Invariant vector fields, Invariant differential operators, One-parameter subgroups, Differential representation.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**.**Eight** questions of equal value will be set, of which any **Five** are to be answered.

MTMS 509: FUZZY MATHEMATICAL STRUCTURES   Credits: 4

Rationale:

A fuzzy set can be defined mathematically by assigning to each possible individual in the universe of discourse a value representing its grade of membership in the fuzzy set. The aim is to introduce the main components of fuzzy set theory and to overview some of its applications. In constructing a model, we always attempt to maximize its usefulness. The aim to construct a model is closely connected with the relationship among three key charactistics, such as, complexity, credibility, and uncertainty. Lotfi A.

Zadeh [1965b] has introduced a theory whose object 'fuzzy set' are sets with boundaries that are not precise. The membership in a fuzzy set is not a matter of affirmation or denial, but rather a matter of a degree. Fuzzy set theory has become an essential part of the curriculum in different discipline of science, especially in applied mathematics, engineering, and technology. The concept of fuzzy sets, fuzzy topology, and fuzzy algebra have been used in decision making in fuzzy environment, fuzzy cluster analysis, fuzzy control system. The concepts of fuzzy subgroupoids, fuzzy subgroups, fuzzy monoid, fuzzy normal subgroups, fuzzy automata theory and pattern recognition, and coding theory have been dealt with.

*Course Objectives***:**

The main objective of this topic is to teach several notions that describe different properties and methods fuzzy topolocal spaces and fuzzy algebra. The objectives of this course are to

1. give basic notion of different terms and operations on fuzz sets in fuzzy set theory
2. introduce fuzzy relational equations and their solution methods
3. introduce the concepts of fuzzy logic
4. introduce the notion of fuzzy topological spaces, continuous functions, fuzzy metric spaces, fuzzy neibourhood spaces, fuzzy convergence fuzzy compact spaces, fuzzy connectedness
5. introduce fuzzy substructures, fuzzy monoid fuzzy automata, fuzzy subgroup and pattern recognition, coding theory theory.

*Learning Outcomes***:**

Upon successful completion of this course, the student will be able to
1. explain basic notion of different terms and operations on fuzz sets in fuzzy set theory
2. understand fuzzy relational equations and can apply their solution methods
3. earn knowledge about fuzzy logic and explain the concepts of fuzzy logic
4. explain the notion of fuzzy topological spaces, continuous functions, fuzzy metric spaces, fuzzy neibourhood spaces, fuzzy convergence fuzzy compact spaces, fuzzy connectedness
5. gain knowledge about fuzzy substructures, fuzzy monoid fuzzy automata, fuzzy subgroup and pattern recognition, coding theory.

Course Content:
1. **Review of basics of Fuzzy sets:** Constructing Fuzzy sets, Operations on Fuzzy sets, t-norm and s-norm, α-Cuts and strong α-Cuts, Extension principle, Measurement of fuzziness, Fuzzy relations, Fuzzy similarity, Fuzzy ordering, Pattern classification based on fuzzy relations.
2. **Fuzzy relational equations:** General discussion, Problem partitioning, Solution methods, Fuzzy relation equations based on sup-i compositions, Fuzzy relation equations based on inf-ω_1 compositions.
3. **Fuzzy logic:** Multivalued logics, Fuzzy propositions, Fuzzy quantifiers, linguistics hedges, Approximate reasoning.

4. **Fuzzy topological spaces:** Fuzzy topologies, F-Continuous functions, Fuzzy metric spaces, Fuzzy neighborhood spaces, Fuzzy convergence, Fuzzy compact spaces, Fuzzy connectedness, Fuzzy components.

5. **Fuzzy algebra:** Fuzzy substructures of algebraic structures, Fuzzy monoids, and fuzzy automata theory, Fuzzy subgroups and pattern recognition, Free fuzzy monoids, and coding theory.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**.**Eight** questions of equal value will be set, of which any **Five** are to be answered.

MTMS 510: DIFFERENTIAL AND INTEGRAL EQUATIONS	Credits:4

Rationale:
This course is intended to develop rigorous practical and analytic skills in differential and integral equations (DIE). It is intended to illustrate various applications of differential and integral equation to technical problems as well. The laws of nature are expressed as differential and integral equations. Scientists and engineers must know how to model the world in terms of differential and integral equations, and how to solve those equations and interpret and analyze the solutions. This course focuses on theoretical aspects of linear and nonlinear differential and integral equations and their applications in science and engineering. More details are given in the course goals below.

Course Objectives:
1. To give knowledge on some basic mathematical analysis of solutions of differential and integral equations.
2. To know how to interpret the solutions of DIE.
3. To learn about the application DIE to model and analyze real-life problems.
4. Numerical solutions of integral equations.

Learning Outcomes:
Students will be able to
1. explain the concept of differential and integral equations
2. expresses the existence-uniqueness theorem of differential and integral equations.
3. explains basic properties of solutions of DIE.
4. Obtain analytic solutions of differential equations.
5. Obtain analytic and semi-analytic solutions of a class of integral equations.

6. Gain knowledge about the applicability of differential equations and integral equations in various branches science and engineering.
7. Approximate solutions of integral equations using various schemes.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**.**Eight** questions of equal value will be set, of which any **Five** are to be answered.

Course Content:
1. **Existence and Uniqueness Theorem of Differential Equations**: Review of existence and uniqueness theorem with some examples, boundedness of solutions.
2. **Stability Analysis**: Stability analysis of linear and nonlinear differential equations, Lyapunov stability analysis
3. **Integral Equations:** Conversions of IVP's to integral equations, existence, uniqueness and general properties of solutions of Volterra integral equations, linear and non-linear systems of VIE's resolving kernels, Fredholm theory of IE's, semi-analytic solutions of a class of integral equations of Volterra and Fredholm types, Singular Integral Equations, Integro-Differential Equations.
4. **Periodic Solutions**: Periodic solutions of linear and non-linear differential and integral equations, Asymptotic behavior of solutions of linear differential equations.
5. **Numerical Solutions of Integral Equations**: Degenerate kernel methods, Projection Methods, Quadrature Methods, Rainer Kress Methods.
6. **Hilbert-Schmidt theory**: Symmetric kernels, Complex Hilbert space, orthogonal system of functions, fundamental properties of eigenvalues and eigenfunction for symmetric kernels, Hilbert-Schmidt theorem with applications.

MTMS 511: OPERATIONS RESEARCH   **Credits: 4**

Rationale:

Operations Research (OR), also called Management Science, is the study of scientific approaches to decision-making problems. Through mathematical modeling, it seeks to design, improve and operate complex systems in the best possible way. This is a comprehensive course covering several areas of OR. The module covers topics that include: linear programming, bounded variable simplex algorithm, transportation and assignment problem, job sequencing, network model, dynamic programming, integer programming, game theory and nonlinear programming. Analytic techniques and computer packages will be used to solve problems facing different real life application oriented decision making problems.

*Course Objectives***:**

The objectives of this course are to:
1. formulate a real-world problem as a mathematical programming model.
2. implement and solve the model using various software packages.
3. solve specialized linear programming problems like the transportation and assignment problems.
4. solve network models like the shortest path, minimum spanning tree, and maximum flow problems.
5. understand the applications of, basic methods for, and challenges in integer programming.
6. understand how to model and solve problems using dynamic programming.
7. learn optimality conditions for single- and multiple-variable unconstrained and constrained nonlinear optimization problems, and corresponding solution methodologies

*Learning Outcomes***:**
1. Students will be able to model and solve some real life oriented problems such as, transportation and assignment problem. Also they will be able to connect these problems with the network models.
2. They will be familiarized with job scheduling problems along with their solution procedures.
3. Application of bounded variable linear program will be understood in modeling several network models.
4. They will learn modeling with integer program along with the solution techniques.
5. Students will get some basic backgrounds on Dynamic programming and Game theory.
6. They will be able to solve constrained and unconstrained nonlinear optimization problems.
7. Students will be able to develop applications using the familiar software tools (EXCEL/SOLVER, LINDO, MATLAB, MATHEMATICA, etc.) to solve problems.

Course Content:
1. **Basics of Operations Research:** Introduction, Definition, Characteristic, Necessity, Scope, Classification of problems, Types of mathematical models, Review of Linear Programming, Bounded Variable Simplex Algorithm.
2. **Transportation and Assignment Problem**: Introduction, Formulation, Relationship with LP, Solution procedure and Applications.
3. **Network Models:** Network definitions, Shortest Route problem, Minimal Spanning Tree problem and Maximal-Flow problem.
4. **Integer Programming:** Introduction, Branch and Bound Algorithm, Cutting-plane Algorithm, Application.
5. **Sequencing Problem:** Sequencing problem processing *n* jobs through two machines, *n* jobs through three machines, two jobs through *m* machines, *n* jobs through *m* machines and approaches to more complex sequencing problems.
6. **Matrix Game Theory:** Introduction, Minimax-maximin pure strategies, Mixed strategies and Expected payoff, solution of *2X2* games, solution (2Xn) and (mX2) games, solution of (m x n) games by linear programming and Brown's algorithm.
7. **Dynamic Programming:** introduction, Investment Problem, Production scheduling problem, Stagecoach problem, Equipment replacement problem.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**.**Eight** questions of equal value will be set, of which any **Five** are to be answered.

MTMS 512: NUMERICAL METHODS FOR DIFFERENTIAL EQUATIONS   Credits:4

Rationale:
There are a lot of naturally occurred processes which can be described using ordinary and partial differential equations (ODEs and PDEs). A thorough knowledge of these processes are acquired solving the relevant equations. This course deals with numerical methods of various types of ordinary and partial differential equations. In particular, finite difference methods (FDMs) for linear and nonlinear ordinary differential equations as well as for elliptic, parabolic, hyperbolic partial differential equations will be discussed. Moreover, students will learn finite element methods (FEMs) in details.

Course Objectives:
1. To learn FDM for linear and nonlinear ODEs.
2. To know how to solve PDEs using FDMs.
3. To find numerical integration using FEM.
4. To provide a detailed knowledge about FEM to solve PDEs.
5. To learn how to solve eigenvalue problem using FEM.

Learning Outcomes:
1. Ability to solve linear and nonlinear ODEs employing FDM
2. Analyze PDEs using relevant FDMs.
3. Find numerical integration using FEM.
4. Apply FEM in solving PDEs.
5. Solve eigenvalue problem utilizing FEM.

Course Content:
Group A: Finite Element Method
1. **Introduction to FEM:** Discretization, Construction of basis functions, Numerical integration; coordinate transformation, local and global derivatives, mesh generation, h-p convergence.
2. **Galerkin Method:** BVP for Ordinary Differential Equations, 2D Poisson's and Laplace's equations, one space dimensional heat and Wave equations.

19

3. **Weighted Residuals Method:** Subdomain, Matrix formulation, Modified Galerkin method to solve 1-D linear and nonlinear BVP.
4. **Finite Element Solution of BVP:** Outline of FE procedures for Poisson's and Laplace's equations, Matrix formulation, Element concept, Triangular, Rectangular and Quadrilateral elements (linear and quadratic elements).
5. **Variational Formulation of ODEs (BVP):** Variational Functional and Construction of functionals, Rayleigh-Ritz method and finite elements.

Group B: Finite Difference Method

6. **Elliptic PDEs:** Review the solution of 2-space variables Poisson's and Laplace's equations, matrix formulation of the model, Stability, and error analysis of methods.
7. **Parabolic PDEs**: Heat equation in 2-space variables, Matrix formulation, Forward, Backward and Crank-Nicolson methods, ADI method, Stability and error analysis of methods.
8. **Hyperbolic PDEs**: Wave equation in 1-space variables, Different types of explicit and implicit methods, Convergence and stability analysis, Wave equation in 2-space variables, Lax-Wendroff and Courant-Friedrichs-Lewy explicit methods, Wendroff implicit method, Wave equation in time-dependent and two space dimensions, Convergence and stability analysis.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**.**Eight** questions of equal value will be set, of which any **Five** are to be answered.

MTMS 513: GEOMETRY OF DIFFERENTIAL MANIFOLDS Credits: 4

Rationale:

Geometry of Differential Manifolds is based on three dimensional basic vector geometry of curves and surfaces with calculus. Understanding of this course students will precede to learn other areas of mathematics such as Differentiable Manifolds, Riemannian Manifolds, Theory of Relativity and cosmology etc. Upon the successful completion of this course students will able to apply the concepts of surfaces to find which surface are minimal surfaces and also to knowWeingarten, Gauss and Codazzi equations, Theorema Egreegium, fundamental theorem ofsurface theory etc.Students will know the concepts of developable surfaces, ruled surfaces, Gaussian curvature, Geodesics, Geodesic curvature, Liouvilles formula, Clairaut's theorem, Bonnet's formula and Gauss-Bonnet theorem.Students will learn about Conformal, isometric and geodesic mapping, Tissot's theorem,

Theory of differential functions, charts, atlases, differentiable manifolds, smooth map on Manifolds,Tangentspace,Tangentbundles, C^∞- vectorfieldsandLiebracketsofvectorfields on Manifolds, φ - related vectorfields.

Course Objectives:
1. Togiveknowledgeonmathematicalconceptsofspacecurveanddifferenttypessurfaces,this course is very muchuseful.
2. Students will know the concepts of geodesic curvature κ_g and its formulae, Liouville's formula, geodesic on a surface of revolution, Clairaut's theorem, Bonnet's formula, geodesics on Liouville surface, Gauss-Bonnettheorem.
3. Students will learn about Manifold structure on a topological space, C^∞- vector fields on manifoldsetc.

*Learning Outcomes***:**
1. Apply Gauss and Weingarten equations to find out Theorema Egreegium and Codazzi's equations.
2. Describe Riccati equation and its solution with someproblem.
3. Know how to check developable surfaces and how to find Gaussian Curvature and which surface is ruled surface orskew.
4. How to find the geodesics for surfaces of plane, sphere, right circular cone, right helicoid, cylinder and torusetc.
5. Illustrate different types of mapping and their properties and proof Tissot's theorem by using non-conformalmapping.
6. Know about compatiability using composite of twocharts.
7. Illustrate the differential structure of manifold with C^∞- function andtopology.
8. Gather Knowledge about smooth map, tangent space, tangent bundles, structure of tangent space map onmanifolds.
9. Apply the concepts of φ - related vector fields to find a lemma and by using this lemma a proposition of Lie brackets of vector fields isproved.

Course Content:
1. **Surfaces and PropertiesofSurface:** Minimalsurfaces, theoremofminimalsurfaces, general solution of the natural equations, Riccati equation and its solution, equation of Weingarten, Gauss and Codazzi and their applications, Theoema Egreegium, fundamental theorem of surfacetheory.
2. **Developable and Ruled Surfaces:** Envelop, characteristic, edge of regression, developable surface, propertyoflinesofcurvatureondevelopable,ruledsurface, fundamentalcoefficients and Gaussian curvature for ruled surface, tangent plane to a ruledsurface.
3. **Geodesics on a Surface:** Geodesics, differential equation of geodesics, geodesics on plane, surface, sphere, right circular cone, right helicoid, cylinder, torus etc., geodesic curvature κ_g

and its formulae, Liouville's formula, geodesic on a surface of revolution. Clairaut's theorem, Bonnet's formula, geodesics on Liouville surface, Gauss-Bonnet theorem, torsion of a geodesic, geodesic parallel.

4. **Mapping of Surfaces:** Mapping, homeomorphism, isometric lines and correspondence, Minding theorem, conformal, isometric and geodesic mapping, Tissot'stheorem.

5. **Differentiable Manifolds:** Theory of differentiable functions, coordinate functions, charts and atlases, complete, compatiablity, differentiable structures, differentiable manifolds, local representation of a function for charts, induced topology on amanifolds.

6. **Topology of a Manifold:** Manifold structure on a topological space, properties of induced topology, topological restrictions onmanifolds.

7. **Differentiation on a Manifolds:** Partial differentiations, equivalence relation andclass, smoothmaponmanifolds, derivation of smooth function and tangent vector, structure of tangent space, independent of tangency relation, tangentspace, tangentbundles, tensorandexteriorbundles, tangent map onmanifolds.

8. **Vector Fields on a Manifolds:** C^{∞} - vector fields on manifolds, coordinates of vector fields, set of vector fields, theorem on vector fields and its coordinates, Lie brackets of vector fields and properties of φ - related vector fields.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**. **Eight** questions of equal value will be set, of which any **Five** are to be answered.

MTMS 514: DYNAMICAL SYSTEMS   **Credits: 4**

Rationale:

Dynamics deals with change which evolve in time. Whether the system in question settles down to equilibrium, keep repeating in cycles, or does something more complicated, it is the dynamics that we use to analyze the behavior in various places of science.

Course Objectives:

At the end of the year students should be able to know:

1. The qualitative properties of dynamics and to understand asymptotic behavior

2. To classify equilibria by their stability, invariant manifolds and topological types
3. Identify fundamental differences between linear and nonlinear dynamical systems
4. Construct and interpret phase portraits of maps and flows
5. Identify fixed points and periodic points and determine their stability
6. How qualitative structure of the flow can change as parameters are varied
7. Unpredictable long-term behavior in a deterministic dynamical system
8. Characterization and measurements of chaos such as sensitive dependence on initial conditions and Lyapunov exponents
9. Use fractals to predict or analyze various biological processes or phenomena.

Learning Outcomes:

After completing this course, the students will be able to understand
1. extend their knowledge of calculus to solve problems in difference (and maybe differential) equations
2. students improve problem solving skills
3. understand the concepts of dynamical systems and to learn how to function in a work group
4. graphical analysis of dynamical systems and understand phase portraits
5. recognize when a dynamical system exhibits chaotic behavior
6. generate fractals and find the topological dimension and fractal dimensions.

Course Contents:

1. **Chaotic Dynamical systems**: Definitions of chaos, sensitive dependence on initial conditions, orbit structure, Cantor set, basin of attractor & repeller, strange attractors, Lyapunov exponents.
2. **Discrete Dynamical Systems**: One parameter family of maps, contractions & fixed points, stability of fixed points, family of logistic map, tent map, linear maps, iterative map, quadratic family, Smale horseshoe map, expanding map, Cantor set.
3. **Differential Dynamical Systems**: One & two dimensional linear & nonlinear differential equations, sinks, source & saddles, stability, population models, Lotka-Volterra models, Henon map, hyperbolic fixed point, manifold and sub-manifold, stable and unstable subspaces, stable manifold theorem, Hartman-Grobman theorem, Hadamard-Perron theorem, Smale theorem.
4. **Bifurcations**: Bifurcations, bifurcation points, Saddle-node, period-doubling, pitchfork, trancritical bifurcation, Hopf bifurcation, backward bifurcation, bifurcation diagram.
5. **Symbolic Dynamical Systems**: Sequence spaces, shift map, symbolic dynamics, subshift of finite type.
6. **Fractal and Multifractal**: Basic concepts of geometric iteration, self-similarity, fractal dimension, chaos game, fractals in nature, Koch curve, Sierpinski triangle, Sierpinski carpet, Multifractal formalis.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**.**Eight** questions of equal value will be set, of which any **Five** are to be answered.

MTMS 515: MATHEMATICAL BIOLOGY	Credits: 4

Rationale:

To provide students with the mathematical tools used to study and solve a variety of problems in biology at different scales. Mathematical Biology is one of the most rapidly growing and exciting areas of Applied Mathematics. This is because recently developed experimental techniques in the biological sciences, are generating an unprecedented amount of quantitative data.

Course Objectives:

By the end of the module the student should be able to:
1. to analyze simple models of biological phenomena using mathematics
2. to reproduce models and fundamental results of biological systems
3. introduce the student to advanced mathematical modeling in the Life Sciences
4. apply methods in the module to new problems inside the scope of Mathematical Biology
5. explore methods for solving the models and discuss the implications of the predictions.

Learning Outcomes:

After completing this course, the students will be able to understand:
1. the applications of ODE models in a variety of biological systems,
2. making the student aware how to choose and use different modeling techniques in different areas
3. reaction-diffusion equations and their applications in biology
4. introduce the connections between biological questions and mathematical concepts
5. develop the mathematics of dynamical systems, linear algebra, differential equations and difference equations through modeling biological systems.
6. explore the utility of using mathematical tools to understand the properties and behavior of biological systems.

Course Contents:

1. **Single Species Continuous Models:** Introduction to linear and nonlinear population models, Sharpe-Lotka age-dependent population model, Gurtin-MaCamy age-dependent population model.
2. **Multi Species Continuous Models:** Two species linear and nonlinear population models, multi-species models, stability. Modeling migration of populations & Evolution of cooperation between individuals.

3. **Microbial Population Models**: Microbial population, chemostat, growth of microbial populations, dynamics of microbial competition, stability.

4. **Dynamics of Infectious Diseases:** Epidemic models, dynamics of infectious diseases, AIDS/HIV models, dynamics of hepatitis B virus, age-dependent epidemic model, control of an epidemic, drug therapy, vaccination effects, treatment of HIV, Immunization and other public health intervention strategies, Modeling vector-borne disease**s.**

5. **Dynamics with diffusion**: Diffusion equation, single and multi-species diffusion models, competition model with diffusion, epidemic model with diffusion, Pattern formations in systems of reaction-diffusion equations.

6. **Stochastic Model**: Concepts in probability, stochastic Processes, Brownian motion, martingales, stochastic linear and nonlinear models of population. Continuous and discrete time Markov Chain.

7. **Applications**: Glucose concentration in blood, heart beat model, blood cell growth, Biomass models, etc.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**.**Eight** questions of equal value will be set, of which any **Five** are to be answered.

MTMS 516: OPERATIONS MANAGEMENT	Credits: 4

Rationale:
Operations activities, such as forecasting, choosing a location for an office or plant, allocating resources, designing products and services, scheduling activities, and assuring and improving quality are core activities and often strategic issues in business organizations. Production Management or Operations Management is the management of systems or processes that create goods and/or services. The material in this course is intended as an introduction to the field of operations management. The field of operations management is dynamic, and very much a part of the good things that are happening in business organizations. Much of what the students learn will have practical application.

*Course Objectives***:**
1. To give knowledge on the ways to manage the business organization efficiently.
2. Students will be able to learn the formulating procedure of different types of management tools.
3. It will help the students to apply the knowledge gather from this course in real life problems.

*Learning Outcomes***:**
After completing this course, the students will be able to an expert in the following areas: in product and service design, process selection, technology selection, design of work systems, location planning, facility planning, quality improvement of goods and services, forecasting, capacity planning, scheduling, managing inventory, assuring quality, motivating employees, and deciding where to locate facilities.

Course Content:

1. **Introduction:**Introduction to Operations Management, The scope of OM, OM and decision making, Productivity, Product mix, Strategy, Competitiveness.
2. **Capacity Planning:**Strategic capacity decision, Strategy formulation, Defining and measuring capacity, Evaluating capacity alternatives.
3. **Quality Control:** Management of quality, Statistical process control, Variations and control, Control charts, Process capability, Improving process capability, Capability analysis.
4. **Forecasting:** Features common to all forecasts, Elements of good forecast, Steps in the forecasting process, Accuracy and control of forecasting, Applications, Forecasting models.
5. **Inventory Control:**Nature and importance of inventories, Introduction to basic inventory models (Economic order quantity (EOQ) model, EPQ model, Fixed order interval model, Single period model.
6. **Scheduling:** Scheduling in high-volume systems, intermediate-volume systems, low-volume systems, Scheduling methods of Linear Programming, Scheduling jobs through two work centers, Minimizing scheduling difficulties, Scheduling the work force.
7. **Simulation:**Basic terminology of simulation, Steps in simulation process, Application of simulation, Simulations with random variables, Advantage and limitations of using simulations.
8. **Project Management:**Behavioral aspect of project management, Key decisions in project management, PERT (program evaluation and review technique), CPM (critical path method), Deterministic time estimates, Probabilistic time estimates, Applications.

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**.**Eight** questions of equal value will be set, of which any **Five** are to be answered.

MTMS 517: QUANTITATIVE FINANCIAL RISK MANAGEMENT	**Credits: 4**
Rationale:	

How modern finance and banking sectors use stochastic models for their day-to-day risk management necessities , including derivative trades, is the main rationale behind offering the course. It provides advanced ideas in the stochastic domain relevant for students to engage in further studies in Mathematical Finance and Actuarial Science.

Course Objectives:

It is a follow up course with prerequisites of 'Stochastic Calculus' and 'Introduction to Mathematical Finance'. The idea and concept of risk management in Banks, Insurance and other financial institutions are covered from stochastic modelling perspectives. Stock markets volatility modeling and stock derivative price modelling are good part of the course. Back-testing risk measures for stock return and other risk measures for derivative investments are covered. In addition to celebrated Black and Scholes model several non-normal derivative pricing models are covered.

Learning Outcomes:
1. Preparing to engage in research degrees in Mathematical Finance and advanced Actuarial Science.
2. Having in-depth idea of how stock market models using Brownian motion and Brownian motion with jumps work in stochastic calculus sense.
3. Concepts of Implied volatility in derivative markets and implied volatility models for derivative pricing will help students engage in quantitative research groups of Banks and Insurance companies that deal with derivatives.
4. GARCH models for financial econometric with non-stationary distributions in stock return modeling; and risk management through Value-at-Risk (VaR) and Expected Shortfall (ES).
5. Backtesting risk measures to understand the performance of risk measures on practical data.

Course Content:
1. **Risk Management, Financial Returns and the Dynamics :** Risk Management and the Firm, A Brief Taxonomy of Risks, Stylized Facts of Asset Returns, Diffusion processes, Jump processes and some GARCH processes for risk management; Empirical Exercises, chapter References for further reading
2. **Volatility Modeling:** Simple Variance Forecasting, The GARCH Variance Model, Extensions to the GARCH Model, Maximum Likelihood Estimation, Variance Model Evaluation, Using Intraday Information, Empirical Exercises, Chapter References for further reading
3. **Correlation Modeling in Finance:** Value at Risk (VaR) for Simple Portfolios, Portfolio Variance, Modeling Conditional Covariances, Modeling Conditional Correlations, Quasi-Maximum Likelihood Estimation, Realized and RangeBased Covariance, VaR from Logarithmic versus Arithmetic Returns, Empirical Exercises, Chapter References for further reading.
4. **Modeling the Conditional Distribution in Finance:** Visualizing Non-Normality, The Standardized t(d) Distribution, The Cornish-Fisher Approximation to VaR, Extreme Value Theory (EVT), The Expected Shortfall (ES) Risk Measure, Empirical Exercises, Chapter References for further reading**.**
5. **Simulation-Based Methods:** Historical Simulation (HS), Weighted Historical Simulation (WHS), Multi-Period Risk Calculations, Monte Carlo Simulation (MCS), Filtered Historical Simulation (FHS), Empirical Exercises, estimating VaR and ES for ARCH/GARCH processes; jump-diffusion

processes; fattailed levy processes; mean reverting processes. Review of Vasicek Model, exponential Vasicek model, CIR model, mean reversion +CIR combined model in order to apply risk measures. Chapter References for further reading

6. **Option Pricing:** Basic Definitions, Option Pricing under the Normal Distribution, Allowing for Skewness and Kurtosis, GARCH Option Pricing Models, Implied Volatility Function (IVF) Models, The CFG Option Pricing Formula, Empirical Exercises, Chapter References for further reading**.**

7. **Modeling Option Risk:** The Option Delta, Portfolio Risk Using Delta, The Option Gamma, Portfolio Risk Using Gamma, Portfolio Risk Using Full Valuation, A Simple Example, Pitfall in the Delta and Gamma Approaches, Empirical Exercises, Chapter References for further reading.

8. **Backtesting Risk Models:** Backtesting VaRs, Increasing the Information Set, Conditional coverage test, Unconditional coverage test, Independence test, and application of backtesting to simulation based models of section 5; Empirical Exercises, Chapter References for further reading**.**

Evaluation: Incourse Assessment: **30** Marks. Final examination (Theory, 4 hours): **Full marks: 70**.**Eight** questions of equal value will be set, of which any **Five** are to be answered.

MTMS 518: SPECIAL TOPICS	**Credits: 4**

Detailed syllabus will be given by the Department.

MTMS 590: MS THESIS	**Credits: 8**

A student has to earn a minimum Honours CGPA as a requirement of getting entry in **Group B (Thesis Group)**. In each academic year, the Departmental Academic Committee determines the minimum CGPA. The students choose his/her supervisor among the faculties of the department subject to approval of the Academic Committee.

Each thesis student is required to work on a specific topic in different fields of mathematics and its applications, prepare a thesis report as a partial fulfillment of requirements for the degree. The thesis work may include original research, review work, and applications of mathematics and may involve fieldwork and use of technology.

Evaluation: The distribution of marks for each thesis shall be as follows:
            Thesis Report   150 marks (6 credits)
            Thesis Presentation   50 marks (2 credits)
